

CodeCademy

Swift

My Choice

- I chose Swift because it's used to build iOS apps, and that felt like a practical skill to try out. I wanted to learn something that connects to real-world apps instead of just basic coding exercises. Swift also seemed like a good option for beginners while still being powerful. Overall, I picked it because it looked useful and different from what we have done before.

Day 1, Monday, 04/13/26

- Today I started learning the basics of Swift. I learned about variables and constants using var and let, and how to store different types of data like strings and integers. I also learned how to print output using print(). Overall, this day helped me understand the foundation of how Swift code is written.

Day 2, Tuesday, 04/14/26

- Today I learned about data types and operators in Swift. I practiced using integers, doubles, booleans, and strings. I also learned how to perform math operations like addition, subtraction, multiplication, and division. This helped me understand how Swift handles calculations and basic logic.

Day 3,
Wednesday,
04/15/26

- Today focused on control flow, including if statements and conditional logic. I learned how to make decisions in code based on conditions. I also explored comparison operators like `==`, `!=`, `<`, and `>`. This made it clear how programs can react differently depending on input or data.

Day 4, Thursday,
04/16/26

- Today I learned about loops in Swift, including for loops and while loops. These allow code to repeat actions multiple times. I practiced looping through ranges of numbers and printing values. This was useful for understanding how to automate repetitive tasks in programming.

Day 5, Friday,
04/17/26

- Today I worked on functions in Swift. I learned how to define functions using func, pass parameters, and return values. Functions help organize code and make it reusable. This made my code cleaner and easier to understand.

Day 6, Saturday,
04/17/26

- Today I learned about collections like arrays and dictionaries. Arrays store lists of items, while dictionaries store key-value pairs. I practiced adding, removing, and accessing elements. This helped me understand how to manage larger amounts of data.

Day 7, Sunday,
04/18/26

- Today I finished the course by learning about optionals and basic Swift structures (structs). Optionals allow variables to have no value (nil), which helps prevent errors. Structs allow you to group related data together. This wrapped up my understanding of how Swift programs are structured.

-

Conclusion

- a) Was this an effective way to learn to code?
It was pretty effective, especially for learning the basics. The interactive parts made it easier to understand compared to just reading or watching videos. It felt a bit repetitive, but overall it helped concepts stick.
- b) How much do you think you learned?
I think I learned a decent amount for a beginner course. I understand the core ideas like variables, loops, functions, and arrays, but I'd still need more practice to feel fully confident using them on my own.
- c) Would you recommend Codecademy be integrated as a regular part of the computer science course?
I'd recommend it as a helper but not the main way of learning. It's good for practice and learning at your own pace but I think having a teacher explain things and doing bigger projects is still important.
- d) Do you think you might visit this site again to continue learning?
Yeah, I probably would. It's easy to use and a good way to keep learning without feeling overwhelmed especially if I want to keep improving my Swift skills.
